

TASK 1.

MOTHERBOARD

CPU

RAM

GPU

HDD (HARD DISK DRIVE)

SSD (SOLID STATE DRIVE)

## TASK 2

### HDD vs SSD Comparison

| Feature           | HDD (Hard Disk Drive)                            | SSD (Solid State Drive)                             |
|-------------------|--------------------------------------------------|-----------------------------------------------------|
| Speed             | Slower                                           | Faster                                              |
| Durability        | Less shock-resistant because it has moving parts | More shock-resistant because it has no moving parts |
| Typical Use       | Desktop PCs, backup and large storage            | Laptops, gaming PCs and modern computers            |
| Noise             | Makes some noise while working                   | Completely silent                                   |
| Power Consumption | Higher                                           | Lower                                               |
| Performance       | Lower performance                                | Better performance                                  |

## TASK 3

### CPU (Processor)

The CPU processes the game's instructions and performs calculations. In games like PUBG or Free Fire, it handles player movement, game logic, and other important tasks.

### RAM (Memory)

RAM temporarily stores the game data and instructions while the game is running. More RAM helps the game run smoothly, especially when other applications are running in the background.

### GPU (Graphics Card)

The GPU renders the game's graphics, images, textures, and visual effects on the screen. A good GPU provides smoother gameplay, better graphics quality, and higher FPS.

## TASK 4

### CPU (Processor)

A high-performance and new-generation processor is needed to process a game like FIFA smoothly.

### RAM (Memory)

16 GB of RAM is recommended because it helps the game run smoothly and reduces the chances of lag or hanging while playing.

#### GPU (Graphics Card)

A newer and upgraded GPU is needed to run the game with better graphics and smooth performance.

#### SSD (Storage)

An SSD with sufficient storage is needed to install FIFA and other applications. Having enough storage allows you to use the PC for multiple tasks along with playing FIFA.
